

Wart & Verruca Treatment

You can follow this regime if you have been diagnosed with a ***viral*** wart or verruca.

We recommend first buying a salicylic acid wart and verruca treatment from a pharmacy.. The higher strength ones work better. We also have stocks of Pickles Ointment at the clinic, which contains 50% salicylic acid.

The salicylic acid dissolves hard and dead skin which sits on top of the wart. Pare down the softened skin when you can with a sharp blade or pumice stone.

After two weeks of softening the wart, you should have a freeze treatment at the clinic. Please book a 15 minute procedure appointment online or email our reception team at reception@oxford-skin.co.uk.

After the freeze treatment, allow the skin to heal for one week and then restart the salicylic acid. Continue using the acid and paring down the softened skin until your next freeze treatment.

Most viral warts will need between 1 and 3 freeze cycles.

Please note, we do NOT recommend this treatment for children under the age of 10.
